                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This polypeptide comprises a human foetal liver kinase 1 binding protein (flk lbp) (see AAW17837) that binds to the receptor tyrosine kinase flk-1 expressed on vascular endothelial and other cells.

The mature flk1-bp can be secreted from host cells transformed with an expression vector including an isolated flk-lbp cDNA clone (see CAM58811). Flk-lbp can be used to isolate cells to which it binds, for use in studying the roles of such cells and of flk-lin crossion vasculogenesis. Angiogenesis inhibition or increased vascularisation may be clinically desirable (e.g. to suppress solid tumour growth or in wound healing, respectively).

The flk-lbp can be administered to treat conditions with defective or insufficient flk-1. Polypeptides may also act as carriers to deliver diagnostic/therapeutic agents to cells to which flk1-bp binds, to generate antibodies, and to identify flk-lbp antagonists of useful for treating flk-lbp mediated conditions.

This polypeptide comprises the pre-pro sequence of human VEGF-C, a novel ligand that binds specifically to human Flt4 receptor tyrosine kinase (VEGFR-3), stimulating phosphorylation of the receptor. Its sequence was deduced from a CDNA clone (AAT84276) obtd. from a PC-3 prostatic adenocarcinoma cell (ATCC CRL 1435) library. The polypeptide, or its active fragments, can be expressed in transformed or transfected host cells for use in claimed methods for detecting endothelial cells (e.g. to image lymphatic vessels, endothelial venules, Flt4 receptor in histochemical tissue) and also to modulate the growth of mammalian receptor in the state of the st
                                                                                                                                                                                                                                                                                              Flt4 receptor tyrosine kinase ligand and related nucleic acid to modulate growth of endothelial cells and for diagnosis of endothelial cell diseases  \begin{array}{c} \\ \\ \\ \\ \end{array}

The products can be used for stimulating angiogenesis, for inhibiting angiogenesis, for stimulating lymphangiogenesis, treatment or prevention of inflammation, oedema, elephantiasis, or Milroy's disease. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used to stimulate lymphocyte production and maturation, and to promote or inhibit trafficking of leucocytes between tissues and lymphatic vessels or to affect migration in and out of the thymus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

The invention provides truncated VRP (VEGF)-C protein) subunits that have at least one amino acid N-terminal to the first Cys of the core sequence deleted. Host cells transformed or transfected with expression vectors containing nucleic acids encoding the truncated VRP subunits are used to produce the truncated proteins recombinantly. The truncated VRP subunits, optionally expressed from gene therapy vectors, have in vivo and in vitro angiogenic activity and are used to stimulate angiogenesis, particularly coronary collateral vessel development in cases of cardiac ischaemia; to stimulate endothelial cell growth and migration in vitro; to treat heart disease; to treat ischaemia (e.g.cardiac, chronic coronary or chronic lower limb ischaemia; stroke and peripheral vascular disease); to promote healing of wounds (of skin or intestines), and to increase vascular permeability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               subunits - lack part of the N-terminal sequence, used to stimulate angiogenesis, e.g. for treating heart disease and ischaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

                                                                                                                    retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote
                                                                                                                                                                                                                                          This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  VEGF-X; vascular endothelial growth factor; human: vulnerary; cytostatic; antirheumatic; antiarthritic; antiporiatic; antidiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore;
                                      skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting anglogenic activity or vascularization. This sequence represents the human VEGC protein used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gordon RD,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                  The present sequence is the protein sequence for the human vascular endothelial growth factor C (VEGF-C). It was used to demonstrate the methods of the invention, which involve the screening of individuals to determine which vascular endothelial growth factor receptor 3 (VEGFR-3, also known as Flt4 or fms-like tyrosine kinase 4) alleles they possess and thus their likelihood of developing hereditary lymphoedema. Conditions associated with lymphoedema include Milroy-Nonne syndrome,
                                                                                                                                                                                                                                                                                                                                                                     altering the receptor-3 -
                                                                                                                                                                                                                                                                                                                                                                                        Screening a human subject for increased risk of developing a lymphatic disorder, comprises assaying a nucleic acid to determine a mutation altering the sequence of a vascular endothelial growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     vascular endothelial growth factor receptor 3; VEGF Milroy-Nonne syndrome; lymphoedema praecox; VEGF-C; vascular endothelial growth factor C.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       method involves administering a compound that inhibits binding of a ligand to FIL4 thereby inhibiting FIL4 mediated proliferation of vascular endothelial cells. The compound is useful for treating neoplastic disease such as breast carcinomas, squamous cell carcinomas, lymphomas, melanomas and sarcomas. FIL4 receptor tyrosine kinase binding compounds can be used for manufacturing medicament useful for diagnostic screening, imaging and treatment of malignancies characterised by FIL4-expressing blood cells. The FIL4 gene maps to chromosomal region 535 and is expressed as 5.8 kb and 4.5 kb mRNAs which differ in their 3' sequences and are differentially expressed in HEL and DAMI cell lines. FIL4 belongs to a subfamily of class III receptor tyrosine kinases (RTKs). It is used as a target for tumour imaging and anti-tumour therapy. The present sequence is a human prepro-vascular endothelial growth factor C (VBGF-C), a specific example of FIL4 binding compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The patent discloses a method to treat neoplastic disease characterised by expression of fms-like tyrosine kinase 4 [Filt4] receptor (also referred as vascular endothelial growth factor receptor-3) in endothelial cells of blood vessels adjacent to malignant neoplasm. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating neoplastic diseases such as lymphoma, carcinomas, melanomas and sarcomas, involves administering a compound capable of inhibiting binding of ligand proteins to fms-like tyrosine kinase-4 receptor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present amino acid sequence is the complete human prepro-vascular endothelial growth factor (VECF)-C. VECF-C has the ability to stimulate re-endothelialisation of an injured blood vessel, without significant stimulation of smooth muscle cell proliferation. It can bind to and stimulate VEGFR-2 (vascular endothelial growth factor receptor) and/or VEGFR-3 phosphorylation in cells that express such receptors. An anti-restenosis agent comprising either a VEGF-C gene or protein is used in a method to reduce or prevent restenosis and stenosis of a blood vessel following vascular trauma e.g., cardiovascular surgery and percutaneous transluminal coronary angioplasty.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC lymphedoema. The method comprises assaying nucleic acid of a human CC subject to determine a presence or an absence of a mutation altering the Sequence or expression of vascular endothelial growth factor receptor 3 (VEGFR-3)/fms-like tyrosine kinase 4 (Flt4) allele (see AAC68952 and CC AAB37604) and determining an increased risk of developing lymphatic CC disorder from presence or absence of the mutation. The presence of a cmutation altering the encoded amino acid sequence or expression of at CC mutation altering the encoded amino acid sequence or expression of at CC least 1 VEGFR-3 allele in the nucleic acid correlates with an increased CC isk of developing a lymphatic disorder. Treatment for hereditary CC lymphedoema can be provided through the administration of vascular endothelial growth factor C (VEGF-C) and vascular endothelial growth CC factor D VEGF-D genes (via gene therapy) and proteins. The present CC sequence is the protein sequence for VEGF-C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                              A human vascular endothelial growth factor (VEGF)-related protein (VRP) (AAW1383) has been identified that binds to, and stimulates the phosphorylation of, the receptor tyrosine kinase FI44. It is postulated to be a third member of the VEGF protein family. Its amino acid sequence was deduced from a CDNA clone (AAT59329) obtd. From a glioma GG1 library. Recombinant VRF can be produced in transformed host cells and used: to promote growth of vascular and lymph endothelial cells; to stimulate phosphorylation of the tyrosine kinase domain of a FI44 receptor; as a diagnostic; as an additive to cell cultures; to screen for (ant)agonists: and to raise monoclonal antibodies used to treat conditions associated with excessive neovascularisation or vascular permeability. VRP may make it possible to avoid coronary by-pass surgery by stimulating growth of the collateral circulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               numen protein similar to vascular endothelial growth factor to treat e.g. wounds, tumours, rheumatoid arthritis, Kaposi sarcoma etc.
                                                                                                                                                                                                                                       Sequence

         The present sequence represents vascular endothelial growth factor-2 (VEGF-2). The VEGF-2 polypeptides have activities similar to VEGF. The VEGF-2 polypeptides stimulate the growth of vascular endothelial cells, stimulate endothelial cell migration, stimulate angiogenesis, decrease blood pressure, and increase blood flow. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating a medical condition. The VEGF-2 polypeptides or polynucleotides may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilization (chemotaxis) of immune cells. The etiology of these immune deficiency of these immune cells.

They can also be used to modulate emostatic or thrombolytic activity. Similarly allergic reactions and conditions such as asthma (particularly allergic asthma) or other respiratory problems, may also be treated.

                                                                                                                   (lymph)angiogenesis. The proteins are also used to identify specific binding agents (potential therapeutic agents) and to raise antibodies. The antibodies are useful as therapeutic (ant)agonists; for detection, purification and targeting of proteins for in vivo or in vitro diagnosis (including imaging) or for therapy (including when linked to e.g. a label or cytotoxin); and for immunotyping of cells, e.g. for detecting minimal residual disease or haematopoietic progenitor/stem cells. It is also contemplated that the sequences might be useful for treating a very wide range of other discretes.
                                                                                                                                                                                                                                                                                              ameliorate disease and to detect diseases, or susceptibility, by detecting mutations or the presence or amount of anyiogenic protein expression. Particularly they are used to stimulate wound healing, growth of damaged bone and tissue, and for repair of vascular tissue, especially peripheral arterial disease, critical limb ischaemia or coronary disease. Antagonists of the sequences are used to inhibit angiogenesis in tumours and to treat inflammation (where associated with increased vascular permeability), diabetic retinopathy, rheumatoid arthritis or psoriasis. Agonists are also useful for stimulating
                                                        range of other disorders, e.g. autoimmune diseases; allergy; cancer; infectious diseases (viral, bacterial, fungal or parasitic); neurodegeneration, also as chemotactic agents or for stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is vascular endothelial growth factor-B (VEGF-B), which is an angiogenic protein of the invention. The angiogenic and the DNA sequences encoding them, are used to prevent, treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; angiogenic protein; wound healing; vascular tissue repair; peripheral arterial disease; critical limb ischaemia; coronary di angiogenesis; tumour; inflammation; diabetic retinopathy; psorias rheumatoid arthritis; autoimmune disease; allergy; cancer; therap infectious disease; neurodegeneration;

The vascular endothelial growth factor C (VEGF-C) polypeptides have activities affecting growth and migration of vascular endothelial cells, promoting growth of lymphatic endothelial cells and lymphatic vessels, increasing vascular permeability, and affecting myelopolesis. The products can be used for stimulating angiogenesis, for inhibiting angiogenesis, for inhibiting angiogenesis, for stimulating lymphaticappenesis, treatment or prevention of inflammation, oedema, elephantiasis, or Milroy's disease. They can also be used to modulate myelopoiesis, e.g. treating granulocytopenia. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells. They can also be used for modulating the growth of endothelial cells and to promote or inhibit trafficking of leucocytes between tissues and lymphatic vessels or to affect migration in and out of the thymus.
                                                                                                                                                                                                                                 Example 35; Page 143-145; 177pp; English
